

Daycare Log

Emily Reller
@relleremilyon GitHub

Description

This is a log for daycare providers to enter in the information for each child. It will track items such as naps, foods, and diaper changes.

Features

- Ability to add classrooms and select if that particular class will need the infant form or toddler form
- Ability to track meal times, what they ate, and the amount they consumed
- Ability to track bottle feeding times and ounces consumed

Planning - User Stories

Users can add students and assign them to certain classrooms.

Users have two forms to choose from. One for infants and one for toddlers.

Users can fill out a daily log each day for all students.

Planning - Database

I'm creating multiple databases. My main databases are Classroom, Student, MealDescription, and BottleFeeding. These will hold majority of the information needed to fill out the forms. I will also have some smaller databases to hold information regarding MealTimes, Food Amounts.

Technology Stack

- C#
- EntityFramework
- Razor
- SQL

What's Next

- I want to add a Login Feature for teachers and parents
- Add images of students and more of their personal information
